Imaging Homelessness in a City of Care
Participatory Mapping with Homeless People
Oliver Moss, Adele Irving

Findings
The composite map displays a complex and often contradictory mix of practices. First, it highlights the large diversity of pathways along which individuals progress into homelessness; “evidence” that, while some people may be more predisposed to falling into homelessness, ultimately, anyone can fall victim. Second, the map highlights the daily challenges associated with street homelessness, as well as the multiplicity of survival strategies employed in response. While many of the strategies in evidence resonate with existing stereotypes, they can also be viewed as instances of “individually cleverly deploying their creativity, competence and cultural knowledge to survive” (Duneier, 1999: 312). Third, it presents a series of counter-readings of the use of city spaces and forms. Doorways, for example, are reproduced as social and sleeping spaces, while pipes and ducts are shown to provide a modicum of warmth and comfort. Finally, it depicts the variety of the city’s homelessness services. While there was evidence of punitive responses to homelessness, most participants spoke highly of the received support.

Participatory Mapping as a Social Research Method
The map proved highly effective in capturing the imaginations of audiences. The project’s launch was attended by over 60 policy makers, practitioners and academics. The project blog has received over 5,000 hits from over 40 countries and the map has received widespread media coverage, with an audience reach of over 2.5 million. The positive reaction appears to be based on the map’s ability to engage audiences instinctively and emotionally. Those offering comments stressed how the map served to emphasise the many different meanings assigned to the city, whilst also presenting the participants as fully emotional subjects with needs, desires and a genuine sense of themselves (May and Cloke, 2014). In this highly polarized context, it is important to both inform and challenge public perceptions of homelessness.

Research Process
The research proceeded by means of six workshops with 30 rough sleepers and users of supported accommodation. Participants were encouraged to annotate two-dimensional maps of the Newcastle city centre with reflections on the spaces, places and experiences significant to their life courses. The maps played a useful prompting role in the surfacing of participants’ experiences, attitudes and values. Many participants were engaged with following a night of rough sleeping, meaning the articulation of life events through conventional talk-based methods would likely have proven challenging. Furthermore, the intuitive nature of map-making was intended to empower participants to take control of the research process. The generated mappings were shared with the artist Lovely Jojo, who prepared a ‘composite’ map. The aim here was to present the participants’ perspectives in a manner that was deliberately lo-fi and therefore in keeping with their selective and subjective nature.
Conclusion

For us, the experience of participatory mapping has confirmed the suggestion that many traditional methods of social science fail to engage with the many aspects of everyday life, thus lying outside the narrow discourse. There are, on occasions, thoughts, feelings and experiences that are simply “unspeakable.” The value of maps such as this one, therefore, lies in their ability to engage an audience instinctively and emotionally, rather than through “rational” argument. Creative approaches to writing, mapping and image-making appear to be just some of the ways in which researchers can seek to access and communicate embodied and pre-reflexive knowledge.
